## Introduction - Goal

I will show how to do simple twitter sentiment analysis in Python with streaming data from Twitter talking about RUSSIAN – UKRAIN WAR AT THIS TIME.

The data is streamed into Apache Kafka, then stored in a MongoDB database, and finally, the results are presented in a dashboard made with Dash and Plotly.

# Pipeline

## Fields Fetched by the Twitter Producer

creation_datetime	The date and time that the tweet was created	
favorites	The total number of favorites the tweet has received	
followers	The total number of followers the user who tweeted has	
location	The location where the tweet happened	
retweets	The total number of times that the tweet has been retweeted	
senti_val	The sentiment score that was given by the TextBlob module algorithm (more on this later)	
subjectivity	The subjectivity score that was given by the TextBlob module algorithm (more on this later)	
text	The full text of the tweet	
user_description	The description that the users provide about themselves on their profiles	
username	The username of the user who tweeted	

the fetched JSON objects are published to the Apache Kafka cluster.

# **Sentiment Analysis**

- After Collecting tweets from twitter , call an external services .In our case we choose Azure cognitive-services for languages and call the API that do the sentiment analysis.
- Output of calling the services are sentiments with their score.
- Ex: 1- Sentence 1: I had the best day of my life.

sentiment: positive

Sentence score: Positive=1.00

Neutral=0.00 Negative=0.00

Sentence2: I wish you were there with me.

Sentence 2 sentiment: neutral Sentence score: Positive=0.21

Neutral=0.77 Negative=0.02

## MongoDB Consumer

# JSON Objects

The MongoDB Consumer is also written in Python. The consumer uses the pymongo module to connect with the desired collection of the MongoDB database.
